

Git Team Workflow — Document Screening System

Brief guide for collaborators and team lead. The repository already contains the full project structure; developers work on their assigned module through feature branches.

1. Overall Flow

2. Important Rule

The branch contains the full repository structure. A module developer does not create a separate repository or delete the other modules. They modify only their assigned module.

Example: Module 3 developer works mainly in **backend/modules/module3_tampering/**. The folder already exists in main.

3. Collaborator Example — Module 3

Start from the latest main:

```
git checkout main
git pull origin main
```

Create the Module 3 feature branch:

```
git checkout -b feature/module3-tampering
```

Now work inside:

```
backend/modules/module3_tampering/
```

4. Save and Push Your Work

```
git status
git add backend/modules/module3_tampering/
git commit -m "feat: implement module 3 tampering detection"
git push -u origin feature/module3-tampering
```

After pushing, inform the team lead: *"Module 3 is ready for review. I pushed feature/module3-tampering."*

5. Team Lead — Pull Request

The team lead does not create the Module 3 folder. It already exists. The lead reviews the branch on GitHub and creates/reviews the Pull Request:

```
feature/module3-tampering -> main
```

If the changes are correct: **Merge Pull Request** → **main**.

6. After the Merge — Synchronize

After any teammate's work is merged, everyone should update their local main before starting new work:

```
git checkout main
git pull origin main
```

If you are continuing on an existing feature branch, first update main, then bring the latest main into your branch:

```
git checkout main
git pull origin main
git checkout feature/<your-branch>
git merge main
```

7. Roles at a Glance

Collaborator	Team Lead
Create feature branch	Review Pull Request
Work only on assigned module	Check changes
Commit changes	Merge feature branch → main
Push feature branch	Ensure main stays stable
Inform lead when ready	Tell team to pull latest main

8. Quick Command Cheat Sheet

```
# Start work
git checkout main
git pull origin main
git checkout -b feature/<module-name>

# Work on your module

# Save work
git status
git add .
git commit -m "feat: describe your change"
git push -u origin feature/<module-name>

# After the branch is merged
git checkout main
git pull origin main
```

9. Team Rules

1. Do not work directly on main.
2. Use one feature branch for the assigned module/task.
3. Do not modify another teammate's module without coordinating.
4. Pull the latest main before starting new work.
5. Use clear commit messages.
6. Merge through GitHub Pull Requests.
7. After a merge, pull the latest main before continuing.
